

Security Operations Center

SOC

Campus Security At A Glance

The Security Operations Center puts all security operations on your campus in one place. It becomes the control center of your security system. It is the main console of the Dynamic Security system, but it is also available as a standalone security integration platform. The SOC allows security personnel to manage the entire campus security system from one place, and to see what is happening everywhere at a glance.

Security personnel can see campus alarms and manage them from the SOC. The SOC allows generation of reports based on the log, alarm records and accumulated data.

About Mad4Biz Security

Made4Biz Security Inc. is a solutions supplier of critical industry security needs. The company develops software that automates the administration of organizational security related tasks. The Made4Biz team has broad security expertise and brings an exceptional understanding of the marketplace and business needs to all aspects of security management.

Functions

- ❑ Security Integration - see campus security at a glance.
- ❑ Holistic security process management
- ❑ Time based scheduling
- ❑ Event Driven Scheduling
- ❑ Visualize Campus Layout
- ❑ Manage Security Log
- ❑ Enables physical security integration
- ❑ Contributes to Regulatory and standards compliance:
 - Sarbanes-Oxley
 - FISMA
 - ISO 17799

Dynamic Security

Operations

- Set Security Policy
- View Status
- View Alarms
- Handle Alarms
- Generate Reports

Applications

- Standalone platform for integrating existing security functions
- Integration of the entire Dynamic Security product family into one comprehensive security business process

Features

- Open Architecture - Standards-based** technology seamlessly integrates with installed physical and IT security management systems. Made4biz Security products support industry standards including SAML, Physbits and Sox.
- Web Service and Service Oriented Architecture (SOA) based.
- Intelligent System - Correlation and Pattern Recognition correlates events related to physical presence and network access.
- Alarms - triggers alarms and prevents unauthorized use of ICT resources.
- Integrates with **Dynamic Security** system to provide intelligent security management.
- Forensic based Investigations (FBI) option- integrates forensic database and uses it in decision making.

The SOC is a security integration platform that allows you to implement convergence of different security systems, manage security policies rationally, maintain the security log and provide holistic security process management. A powerful scheduler allows implementation of time-based or event driven applications. The SOC provides a visual representation of campus layout and shows personnel where problems are developing.

The security challenge

According to ASIS, theft of proprietary information has cost over \$50 billion annually in recent years. Identity theft has been singled out as a major concern by US GAO report GAO-02-363.

Increasingly, firms are looking to convergent security solutions that integrate physical and ICT security. Forrester estimated that in 2005, firms would treble spending on integration of physical and IT security systems. Physical Access Control, CCTV, RFID and others will be integrated with Single Sign-On, Identity Management, and security incident management into one holistic security process.

The Security Operations Console helps you bridge separate islands of security technology created by individual applications to provide a central, smart security management system.. It can operate as a standalone system or form the basic building block of a Dynamic Security system.
